

Handguard scrub

Antiseptic Surgical Hand and skin scrub

Composition

Chlorhexidene gluconate IP - 20% v/v

(Equivalent to - 4% w/v

chlorhexidene gluconate with emollients, moisturizer, permitted colour and fragrance)

PERSISTANT AND RESIDUAL ACTIVITY

Mode of action

chlorhexidine has the unique ability to bind to the proteins present in human tissues such as skin and mucous membranes with limited systemic or bodily absorption. Protein bound chlorhexidine releases slowly leading to prolonged activity. This phenomenon is known as substantivity and allows for a longer duration of antimicrobial action against a broad spectrum of bacteria and fungi. In fact, chlorhexidine's antimicrobial activity has been documented to last at least 48 hours on the skin.¹⁴ Unlike povidone-iodine, chlorhexidine is not affected by the presence of body fluids such as blood.

Chlorhexidine has also been applied to medical devices such as dental implants, vascular catheters, needleless connectors and antimicrobial dressings. Chlorhexidine, when applied to or impregnated in medical devices kills organisms and protects against microbial colonization and subsequently bio film development.
